Protected Port on EtherSwitch HWICs on Modular Integrated Services Routers

First Published: June 28, 2007
Last Updated: June 28, 2007

This feature allows you to configure protected port security on all modular platforms with installed 4- or 9-port high-speed WAN interface card (HWIC) modules. Some applications require that no traffic be forwarded between ports on the same device so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the device.

Finding Feature Information in This Module
Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “Feature Information for Protected Port on EtherSwitch HWICs on Modular Integrated Services Routers” section on page 10.

Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images
Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for Protected Port on EtherSwitch HWICs on Modular Integrated Services Routers

The following Integrated Services Routers (ISRs) support the protected port feature:

- Cisco 1841ISR
- Cisco 2800 series ISRs, including models 2801, 2811, 2821, and 2851
- Cisco 3800 series ISRs, including models 3825 and 3845

To support the protected port feature, the Cisco routers listed above must be equipped with one of the following HWICs:

- HWIC-4ESW
- HWIC-D-9ESW

Restrictions for Protected Port on EtherSwitch HWICs on Modular Integrated Services Routers

The protected port feature can be configured only on the switch ports attached to the specified HWICs installed in a supported Cisco ISR.

Information About Protected Port on EtherSwitch HWICs on Modular Integrated Services Routers

Before configuring the protected port feature on a router, you should understand the following concept:

- How the Protected Port Feature Works, page 2

How the Protected Port Feature Works

Some applications require that no traffic is forwarded between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.
Protected ports have these features:

- A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Traffic cannot be forwarded between protected ports at Layer 2; all traffic passing between protected ports must be forwarded through a Layer 3 device.
- Forwarding behavior between a protected port and a nonprotected port proceeds as usual.

The default is to have no protected ports defined.

**How to Configure Protected Port on EtherSwitch HWICs on Modular Integrated Services Routers**

This section explains how to configure the protected port feature on the 4- and 9-port HWICs in a modular ISR.

**Restrictions**

The protected port feature can be configured only on the switch ports attached to the specified HWICs in a Cisco ISR.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface [interface id]`
4. `switchport protected`
5. `end`

Configuration Examples for Protected Port on EtherSwitch HWICs on Modular Integrated Services Routers

This example shows how to configure Fast Ethernet interface 0/3 as a protected port and verify the configuration:

```
Router# configure terminal
Router(config)# interface fastethernet 0/3
Router(config-if)# switchport protected
Router(config-if)# end
```

```
Router# show interface fastethernet 0/3 switchport
Name: Gi0/3
Switchport: Enabled
Administrative Mode: static access
Operational Mode: down
Administrative Trunking Encapsulation: dot1q
Negotiation of Trunking: Disabled
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Trunking VLANs Enabled: ALL
Trunking VLANs Active: none
Protected: true
Priority for untagged frames: 0
Override vlan tag priority: FALSE
Voice VLAN: none
```
Appliance trust: none
Router#

Router# show running interface fastethernet0/3/0
Building configuration...

Current configuration : 57 bytes
!
interface FastEthernet0/3/0
  switchport protected
end

## Command Reference

This section documents only commands that are new or modified.

- **switchport protected**
switchport protected

Use the `switchport protected` command to isolate unicast, multicast, and broadcast traffic at Layer 2 from other protected ports on the same switch in interface configuration mode. To disable protection on the port, use the `no` form of the command.

```
switchport protected
no switchport protected
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
No protected port is defined. All ports are nonprotected.

**Command Modes**
Interface configuration (config-if)

**Command History**

**Usage Guidelines**
The switchport protection feature is local to the switch; communication between protected ports on the same switch is possible only through a Layer 3 device. To prevent communication between protected ports on different switches, you must configure the protected ports for unique VLANs on each switch and configure a trunk link between the switches.

Beginning with Cisco IOS Release 12.4(15)T, the following Cisco ISRs support port protection when an appropriate high-speed WAN interface card (HWIC) is installed:

- Cisco 1841 ISR
- Cisco 2800 Series ISRs, including models 2801, 2811, 2821, and 2851
- Cisco 3800 Series ISRs, including models 3825 and 3845

To support port protection, the Cisco routers listed above must be equipped with one of the following HWICs:

- HWIC-4ESW
- HWIC-D-9ESW

**Note**
Only the ports attached to the HWICs can be configured with port protection.
A protected port does not forward any unicast, multicast, or broadcast traffic to any other protected port. A protected port continues to forward unicast, multicast, and broadcast traffic to unprotected ports and vice versa.

Port monitoring does not work if both the monitor and monitored ports are protected ports.

A protected port is different from a secure port.

**Examples**

The following example shows how to enable a protected port on an interface:

```
Switch(config)# interface gigabitethernet0/3
Switch(config-if)# switchport protected
```

You can verify the previous command by entering the `show interfaces switchport` privileged EXEC command.

Feature Information for Protected Port on EtherSwitch HWICs on Modular Integrated Services Routers

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.
